

RADIOLOGY REPORT

Study Date : 2024-08-15

Patient ID : P-2026-0884

Patient : Zhang Wei (Male, 55 years)

Modality : CT Thorax — Axial, Coronal, Sagittal

Referring : Dr. Lin Jia (Pulmonology)

CLINICAL INDICATION:

Persistent cough. Rule out early pulmonary malignancy.

TECHNIQUE:

Non-contrast + contrast-enhanced multi-slice CT thorax at 3mm intervals.

FINDINGS:

Lungs:

Right lower lobe: A small hyperdense nodule measuring approximately 9 mm in greatest dimension (axial plane). Margins are relatively well-defined with mild lobulation. No satellite nodules identified.

Left lung: No focal abnormality.

Mediastinum: No mediastinal lymphadenopathy.

Pleura: No pleural effusion or thickening.

Bony thorax: No suspicious lytic or blastic lesions.

IMPRESSION:

1. Solitary pulmonary nodule, right lower lobe, ~9 mm.

Differential includes benign granuloma vs. primary pulmonary neoplasm.

2. Recommend follow-up CT in 12 months or earlier if symptoms progress.

Reporting Radiologist: Dr. Chen Mei (■■■), MD FRCR

Date Signed : 2024-08-16

Report ID : RAD-2024-08-P0884
